## Task 1 Version 1

Name $\qquad$
Amy has a flyer that she wants to distribute to everyone in her college. She walks into the campus mail room and sees the rows of mailboxes. She knows that she cannot count each mailbox because she needs to get to a class. She must figure out a way to determine how many mailboxes there are so she knows how many copies of her flyer she needs. Help Amy figure out how many mailboxes there are using the picture below. See if you can do this in at least 3 different ways. Use each picture to represent only one way.

2. Does this model represent the mailbox problem? If so, how? Please provide your reasoning.

## Reasoning:

3. Use the base ten block model in 3 different ways to find how many mailboxes there are total. Write a symbolic representation that matches what you did with the model.

2. Does this model represent the mailbox problem? If so, how? Please provide your

Reasoning:
yes, bic there is still the same amount of boxes, Just broken up differently.

2. a) A student said that you can create a replica of the $29 \times 23$ grid with 6 flats, 6 rods, and 7 small cubes. Is this student correct? Why or why not? Support your reasoning by drawing the mailbox grid with these given pieces below. Use the given graph paper, if needed.

b) What would be the smallest number of base ten pieces that you can use to replicate the $29 \times 23$ rectangular grid? Draw a picture of your representation below and provide your reasoning for how you know this is the smallest number of pieces. Use the given graph paper, if needed.

## Task 3 Version 7.2

Name $\qquad$
3. a) Katia solved the mailbox problem by multiplying $29 \times 23$ using the partial products multiplication algorithm

|  | $\mathbf{2}$ | $\mathbf{9}$ |
| ---: | :---: | :---: |
| x | $\mathbf{2}$ | $\mathbf{3}$ |
| 4 | 0 | 0 |
|  | 6 | 0 |
| 1 | 8 | 0 |
| + | 2 | 7 |
| 6 | 6 | 7 |

i). Figure out where the $400,60,180$ and 27 are coming from.
ii). Show the 400, 60, 180 and 27 from the algorithm in the picture below.

Task 3 Version 7.2

3. b) Marcus solved the mailbox problem by multiplying $29 \times 23$ using the traditional multiplication algorithm:

|  | $\mathbf{2}$ | $\mathbf{9}$ |
| ---: | :---: | :---: |
| x | $\mathbf{2}$ | $\mathbf{3}$ |
|  | 8 | 7 |
| + | 5 | 8 |
| 6 | 6 | 7 |

i) Figure out where 87 and 580 are coming from.
ii) Show the 87 and 580 from the algorithm in the picture below.

Name $\qquad$
3. c) Break up this picture in a way that is different from the two above and label the regions. Then write a symbolic representation that models how you broke up $29 \times 23$ in the picture.

## Symbolic Representation:

$29 \times 23=$ $\qquad$
